

More accurate PCFG models

Computational Linguistics

Alexander Koller

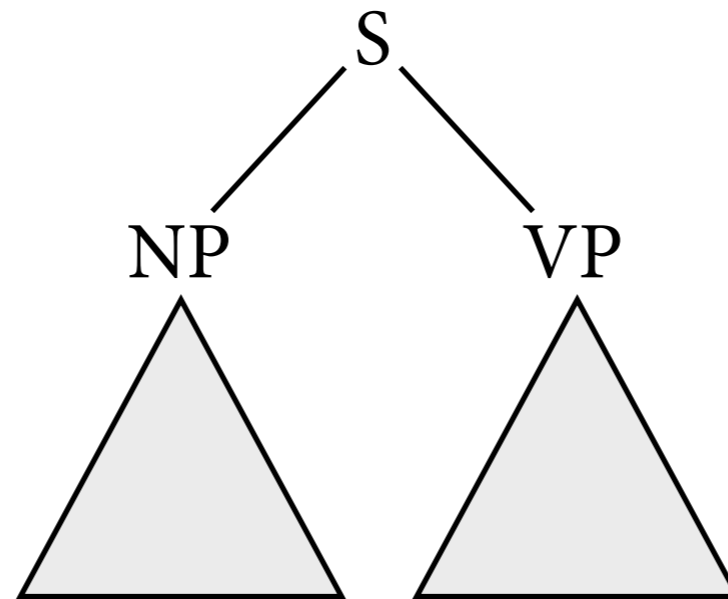

6 December 2019

The story so far

- Train PCFG with MLE on the Penn Treebank 02-21.
- Compute parse trees for PTB 23 using Viterbi-CKY.
- Trick against data sparseness in lexicon:
delete words, train and test on sequences of POS tags.
- This yields labeled f-score in the low 70's.
 - ▶ Why so low?
 - ▶ How can we fix it?

Fundamental problem of PCFGs

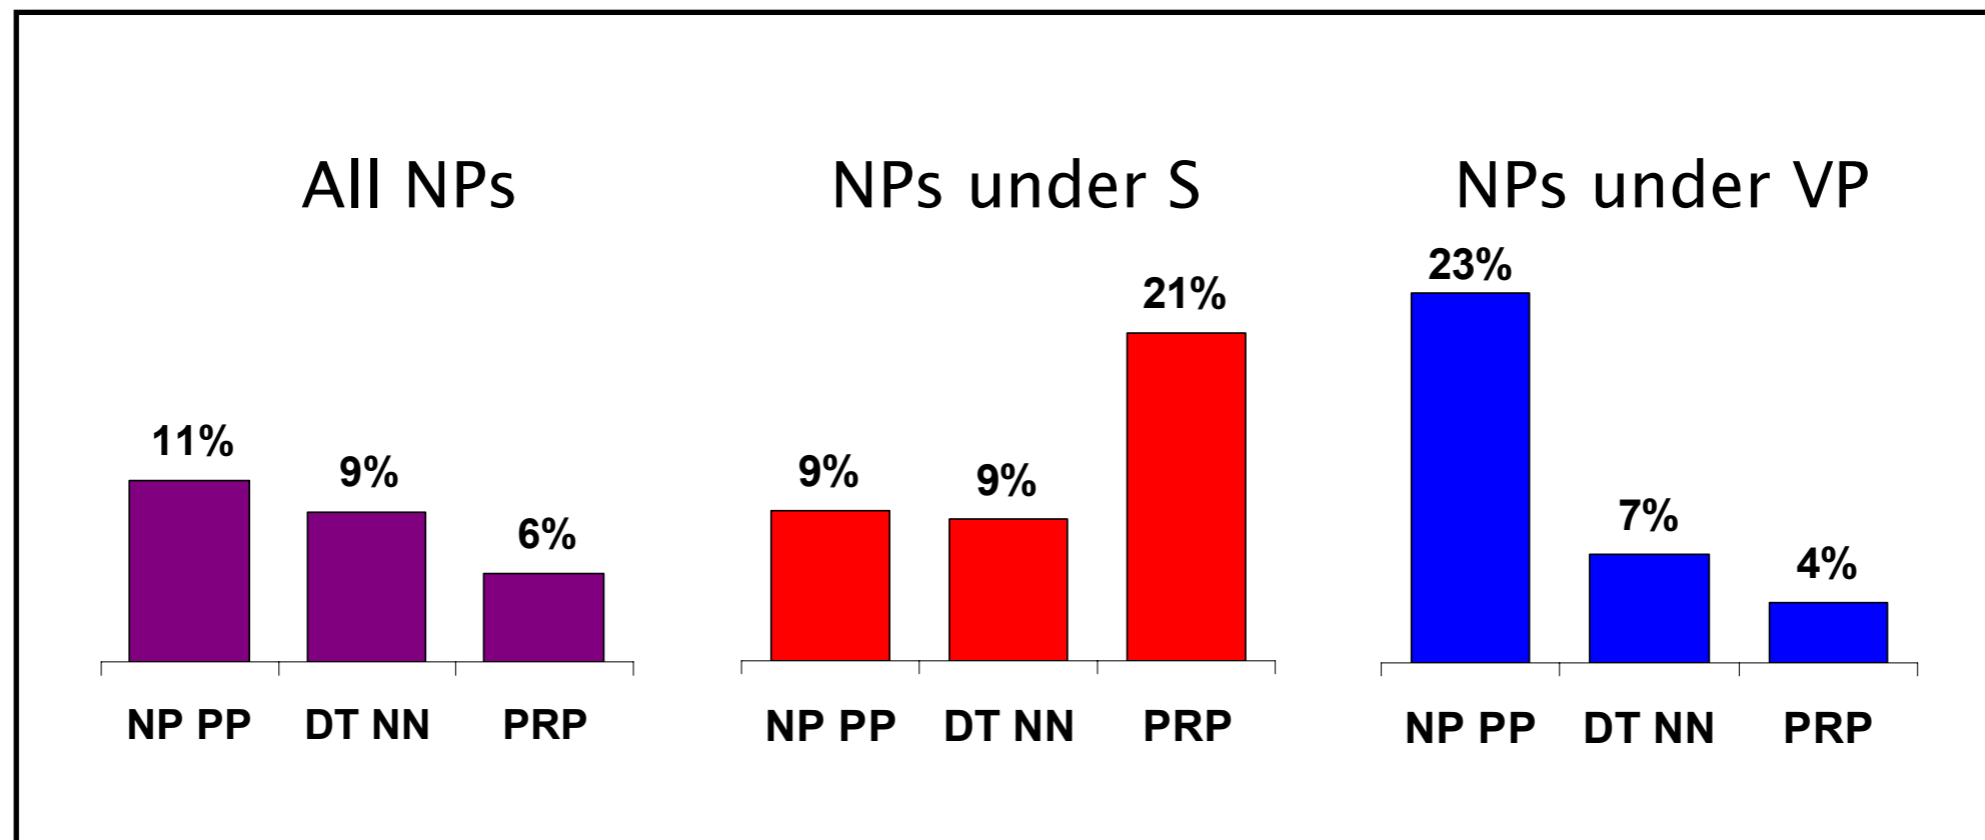

- Context-free grammar: One rule can only “see” parent and its children, not anything above or below.
- PCFG: Assumes statistical independence of all rewrite events.

NP → PRP?

NP → Det N?

Independence assumptions

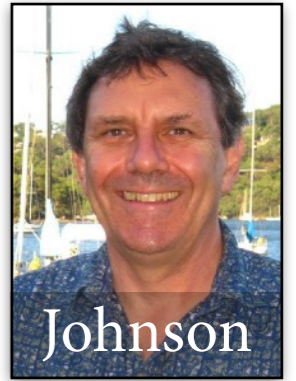

Independence assumptions

- Accurate disambiguation of PP attachment requires lexical information.
 - ▶ I shot the elephant with a long trunk.
 - ▶ I shot the elephant with a long rifle.
- PP attachment influenced by choice of P.
 - ▶ Collins note: “workers dumped sacks *into* a bin”
 - ▶ *into*-PPs in PTB 9x more likely to attach to VP than to N
- PCFGs rely on nonterminals alone, cannot “see” lexical information.

Directions

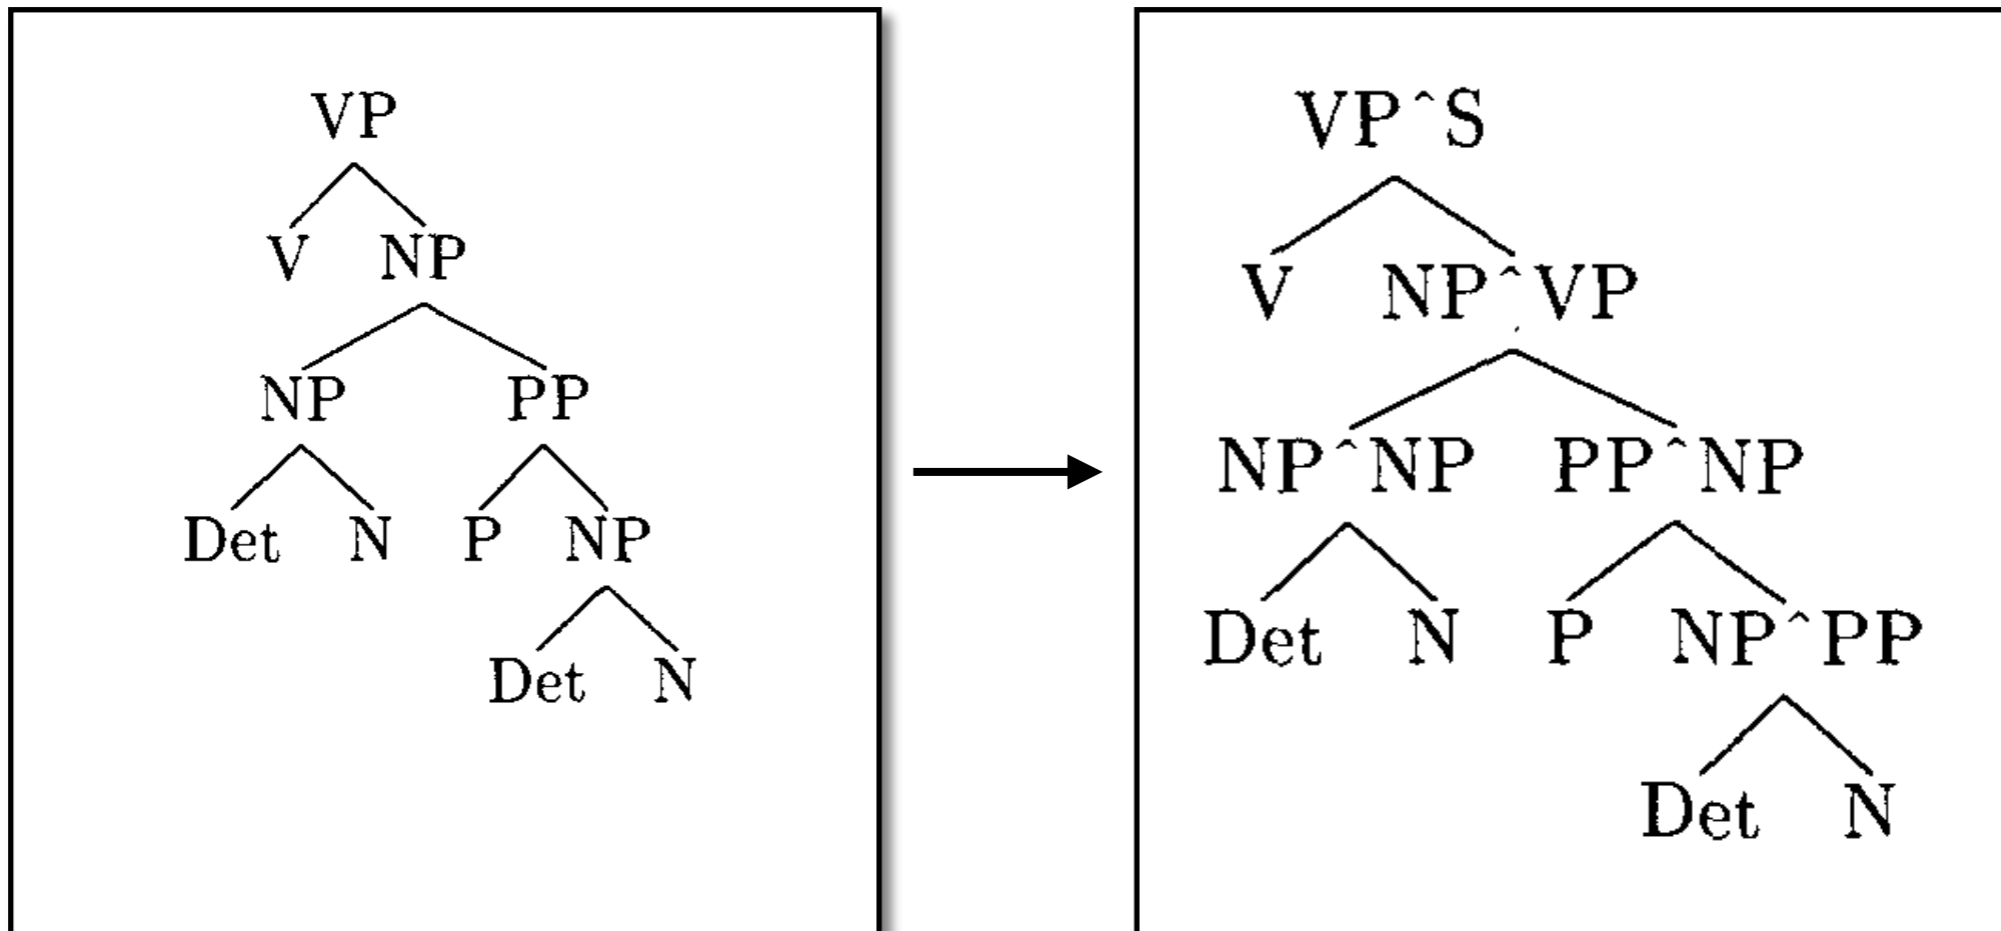

- Need to make nonterminals more informative to make PCFG rules sensitive to more context.
- Several approaches discussed today:
 - ▶ Johnson 98: Parent annotations
 - ▶ Collins 97: Lexicalized PCFGs
 - ▶ Klein & Manning 03: Unlexicalized PCFGs with nonterminals split by hand
 - ▶ Petrov & Klein 06: Unlexicalized PCFGs with automatically learned nonterminal splits

Johnson 1998

- Discusses PTB preprocessing and impact of PTB representation changes.
- One key idea: *parent annotations*.
 - ▶ If parent of NP makes such a difference in how it should be expanded, why don't we encode the parent of the NP?
 - ▶ Replace nonterminal NP by NP^S (NP as child of S), NP^{VP} (NP as child of VP), and so on in PTB trees.
 - ▶ Train grammar on modified treebank.
After parsing, remove annotations and compare to gold standard tree.

Example

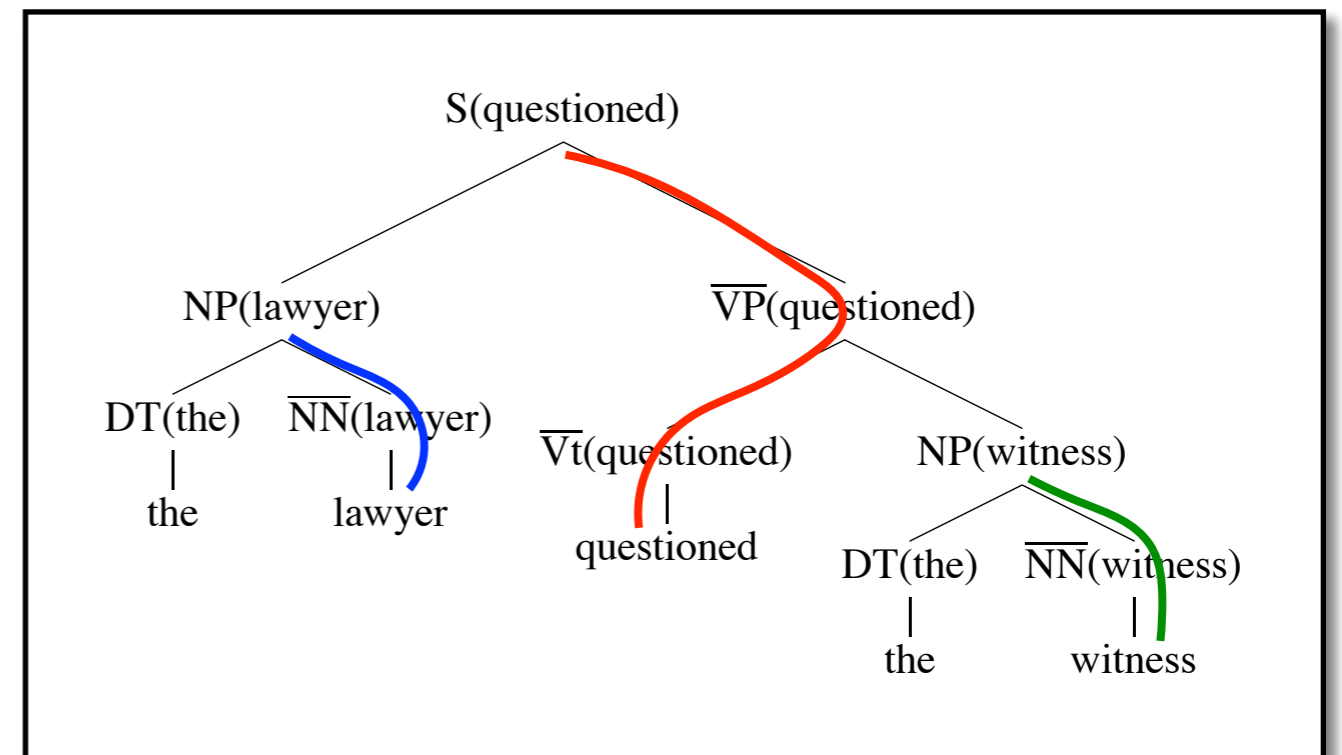

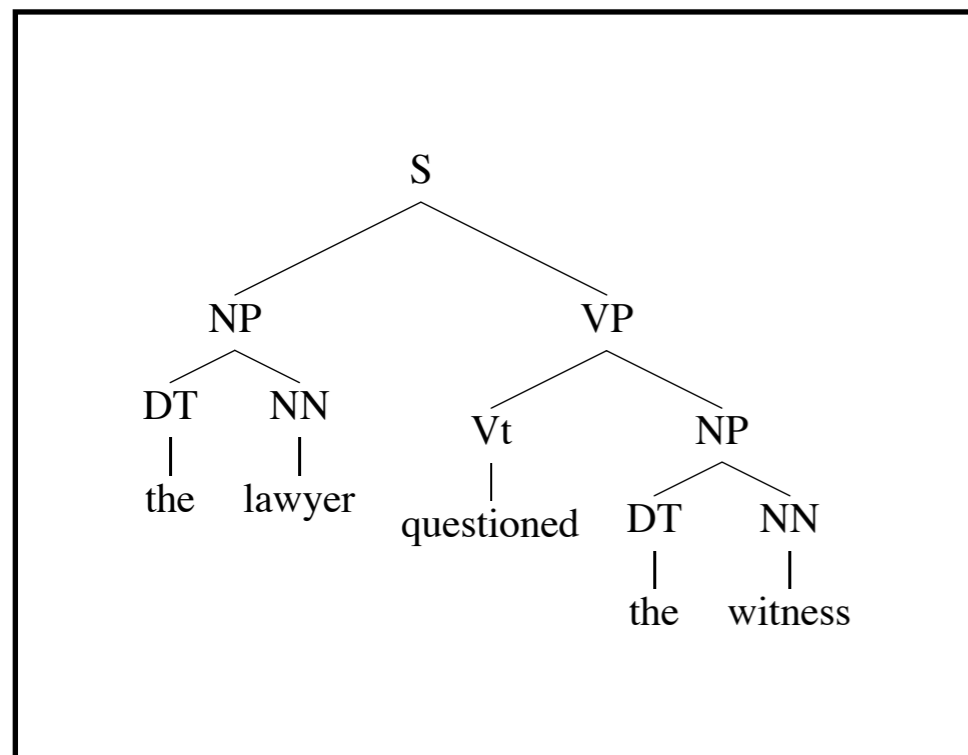

Result: Labeled f-score on Section 22 jumps from 71.5 to 79.6.
Number of production rules grows from 15,000 to 22,000.

Lexicalized parsing

- Fundamental idea: If words are so important to distribution of rules, let's put them in the rules.
- Step 1: Mark each node in PTB with its *lexical head*.
 - ▶ identify head automatically using hand-written rules

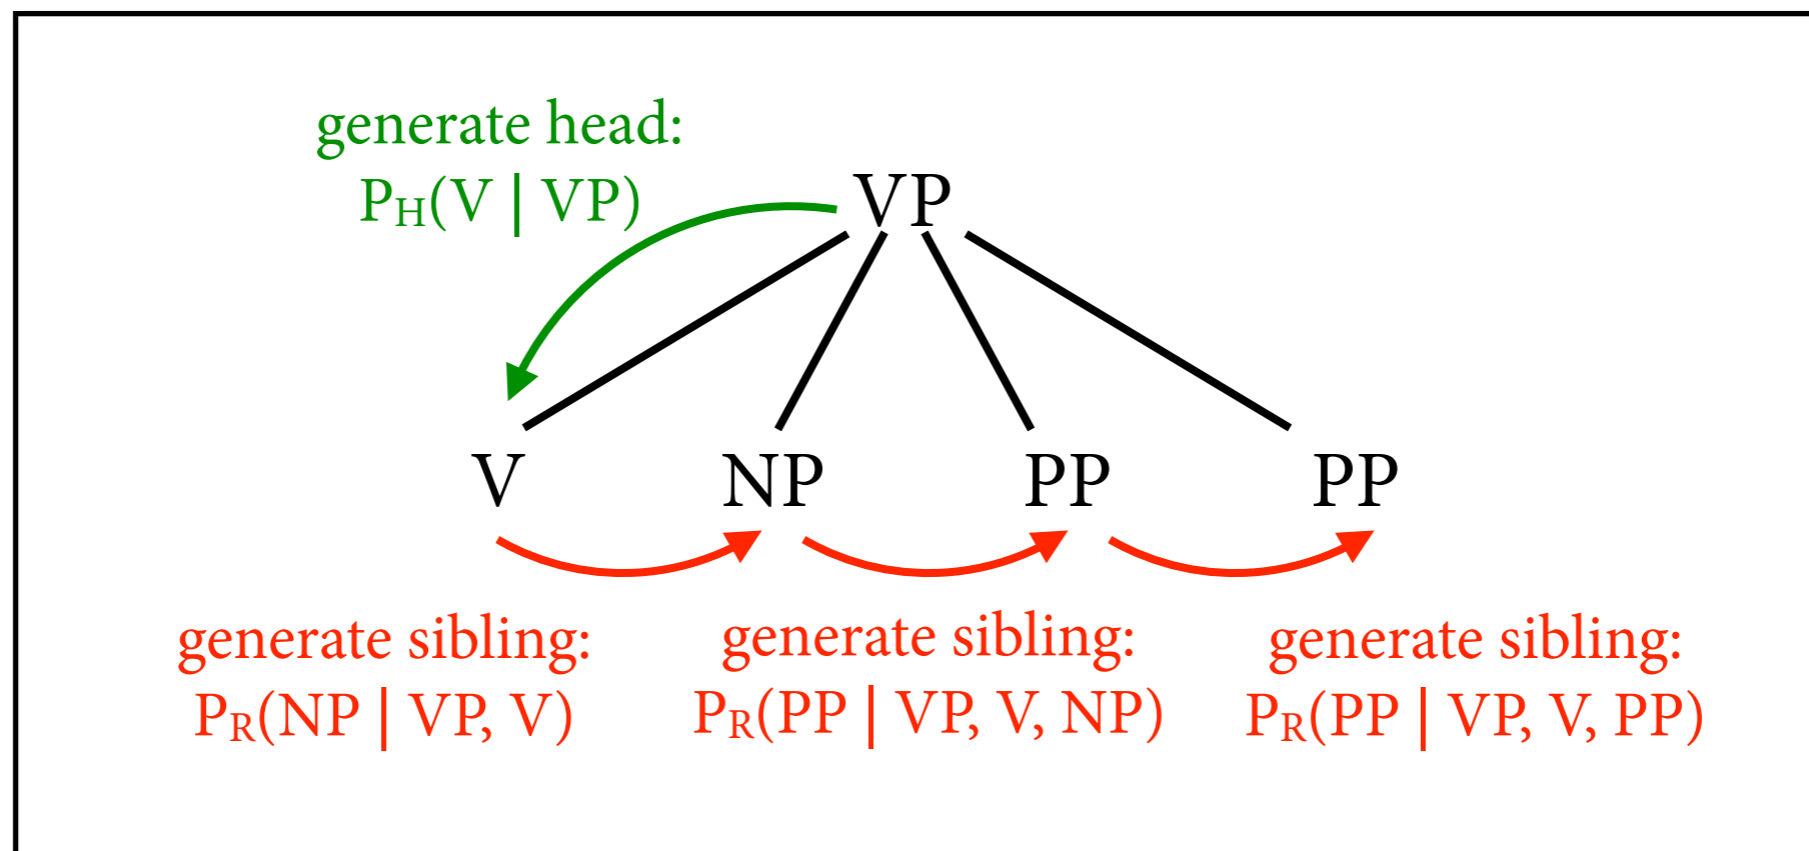

Lexicalized PCFGs

- Step 2: Read off lexicalized PCFG from treebank.
 - ▶ rules of the form $S(\text{examined}) \rightarrow_2 NP(\text{lawyer}) VP(\text{examined})$
 - ▶ “2” on arrow indicates that second child is head
- MLE and Viterbi-CKY adapt easily to new setting.
So we’re basically done!
- But! Number of rules multiplied by V^r
(V = vocabulary size, r = rank of rules).
 - ▶ ordinary rule \times head word \times heads of other children
 - ▶ increases number of parameters accordingly
 - ▶ astronomical sparse data problem

Dealing with sparse data

- Horizontal Markovization:
 - ▶ break rules up into parts by generating children one by one
 - ▶ independence assumptions: child depends on limited context

Dealing with sparse data

- This helps a lot, but is still not enough for rare events.
- Need aggressive smoothing. Collins uses interpolation:
 - ▶ $p_1 = C(S \rightarrow NP VP, H = \text{examined}) / C(S, H = \text{examined})$
 - ▶ $p_0 = C(S \rightarrow NP VP) / C(S)$
 - ▶ $P(S \rightarrow NP VP \mid S, \text{examined}) = \lambda p_1 + (1-\lambda) p_0$
 - ▶ estimate λ from data

Collins 1997 (with more complex lexicalization model):
f-score 87.7 on PTB word strings of length ≤ 40

Parsing speed

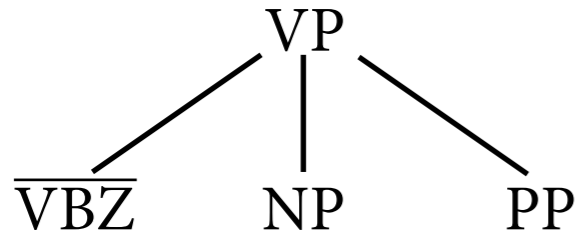

- Parsing slower than usual, because
 - ▶ grammar is much bigger
 - ▶ must be careful in managing head words
- Key insight: head word of (A,i,k) must be one of w_i, \dots, w_{k-1} ; use pointers into input string.
 - ▶ this gives $O(n^5)$ parsing time with acceptable memory use
 - ▶ Eisner & Satta 99: can do it in $O(n^4)$ with clever algorithm — still too slow in practice
 - ▶ use beam search to maintain only best hypotheses for each chart cell

Unlexicalized parsing

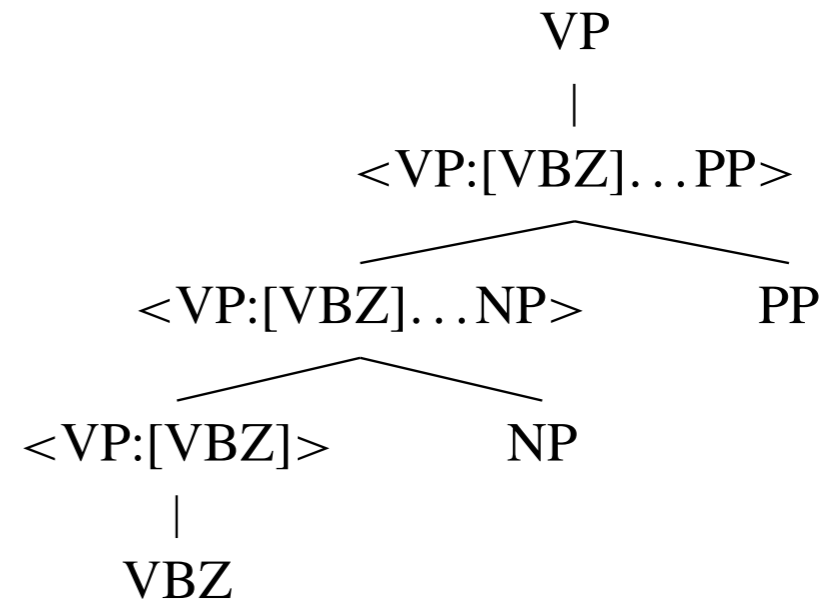

- Is lexicalization really as helpful as it seems?
 - ▶ Gildea 01: what counts is effect of head word on choice of subcategorization frame, not bilexical dependencies
 - ▶ Dubey & Keller 03: bilexical dependencies not useful when parsing German
 - ▶ Even lexicalized parsers (e.g. Collins 99, Charniak 00) make use of non-lexical splits of nonterminals.
- Klein & Manning 03: Perhaps usefulness of lexicalization is primarily in giving us more nonterminals?
Can we get the same effect more cheaply?

Markovization

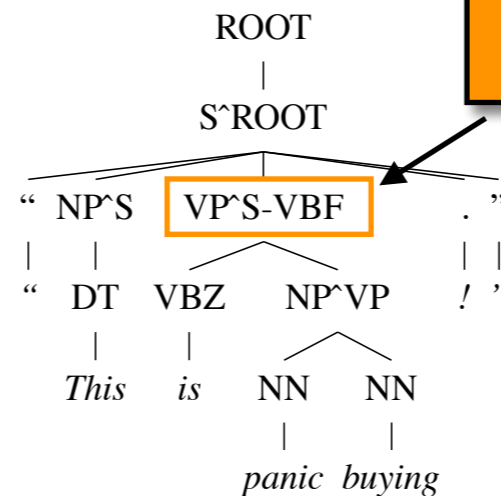

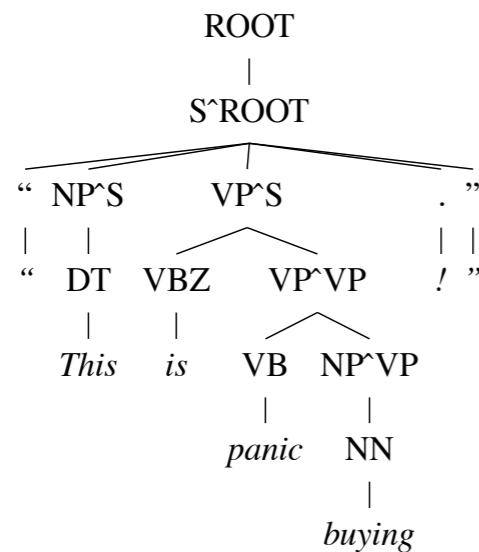

horizontal Markov
 $h = 1$

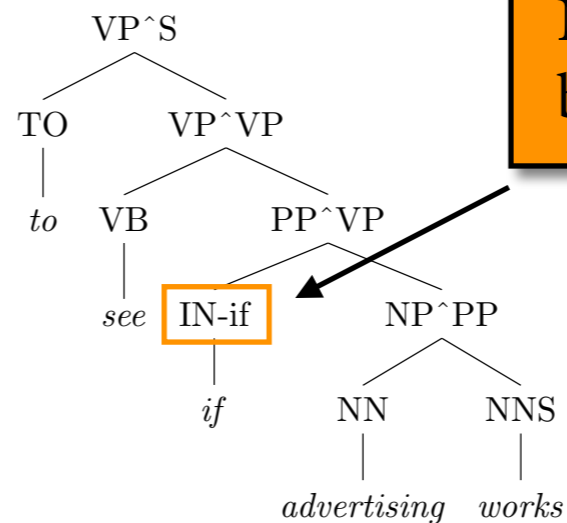

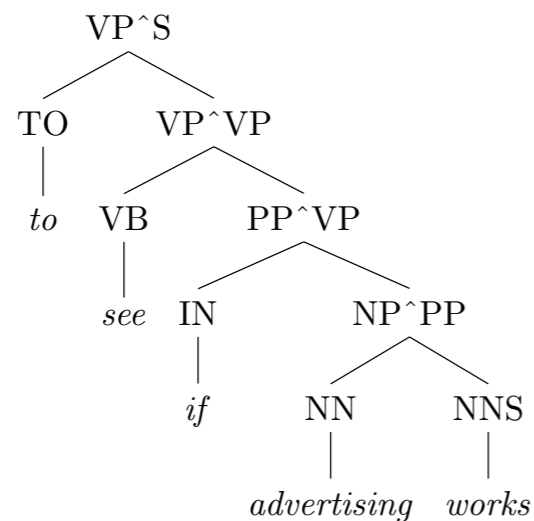

Vertical Markovization:
 $v = 2$ is parent annotations
 $v = 3$ grandparent, etc.

Vertical Order		Horizontal Markov Order				
		$h = 0$	$h = 1$	$h \leq 2$	$h = 2$	$h = \infty$
$v = 1$	No annotation	71.27 (854)	72.5 (3119)	73.46 (3863)	72.96 (6207)	72.62 (9657)
$v \leq 2$	Sel. Parents	74.75 (2285)	77.42 (6564)	77.77 (7619)	77.50 (11398)	76.91 (14247)
$v = 2$	All Parents	74.68 (2984)	77.42 (7312)	77.81 (8367)	77.50 (12132)	76.81 (14666)
$v \leq 3$	Sel. GParents	76.50 (4943)	78.59 (12374)	79.07 (13627)	78.97 (19545)	78.54 (20123)
$v = 3$	All GParents	76.74 (7797)	79.18 (15740)	79.74 (16994)	79.07 (22886)	78.72 (22002)

Rule-based state splitting

Not just an VP^S,
but one whose head is a finite verb.

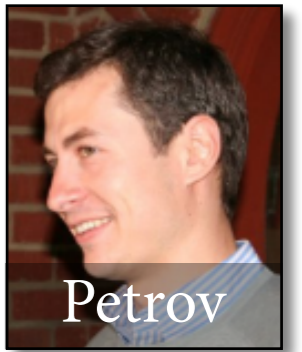

Not just a preposition,
but one that is like "if".

Results

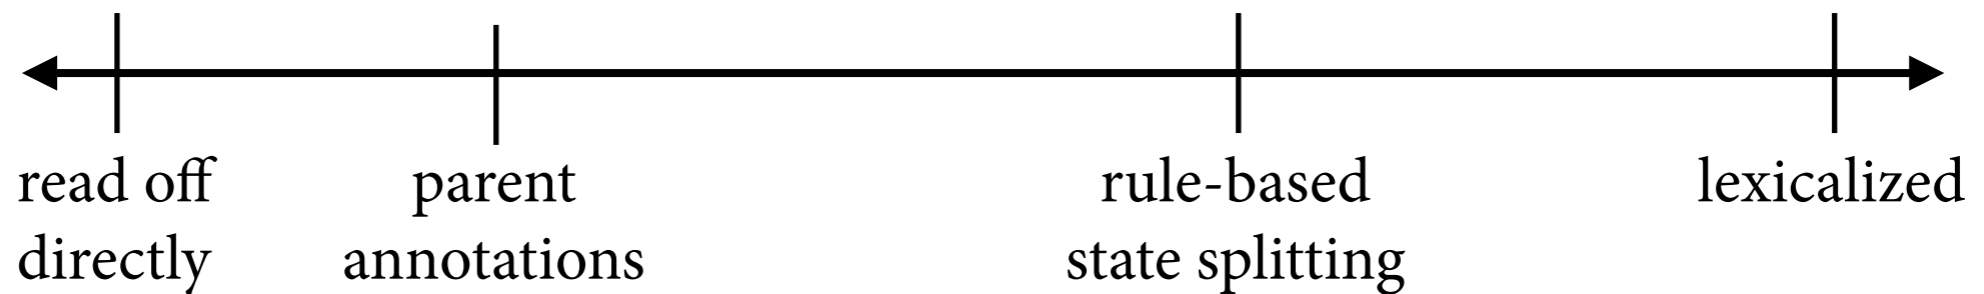

Annotation	Cumulative			Indiv.
	Size	F ₁	Δ F ₁	Δ F ₁
Baseline ($v \leq 2, h \leq 2$)	7619	77.77	–	–
UNARY-INTERNAL	8065	78.32	0.55	0.55
UNARY-DT	8066	78.48	0.71	0.17
UNARY-RB	8069	78.86	1.09	0.43

SPLIT-AUX	9034	81.66	3.89	0.57
SPLIT-CC	9190	81.69	3.92	0.12
SPLIT-%	9255	81.81	4.04	0.15
TMP-NP	9594	82.25	4.48	1.07
GAPPED-S	9741	82.28	4.51	0.17
POSS-NP	9820	83.06	5.29	0.28
SPLIT-VP	10499	85.72	7.95	1.36
BASE-NP	11660	86.04	8.27	0.73
DOMINATES-V	14097	86.91	9.14	1.42
RIGHT-REC-NP	15276	87.04	9.27	1.94

Compare against f-score 87-89 of lexicalized parsers.
But much smaller grammars, simpler and faster parsing!

State splitting

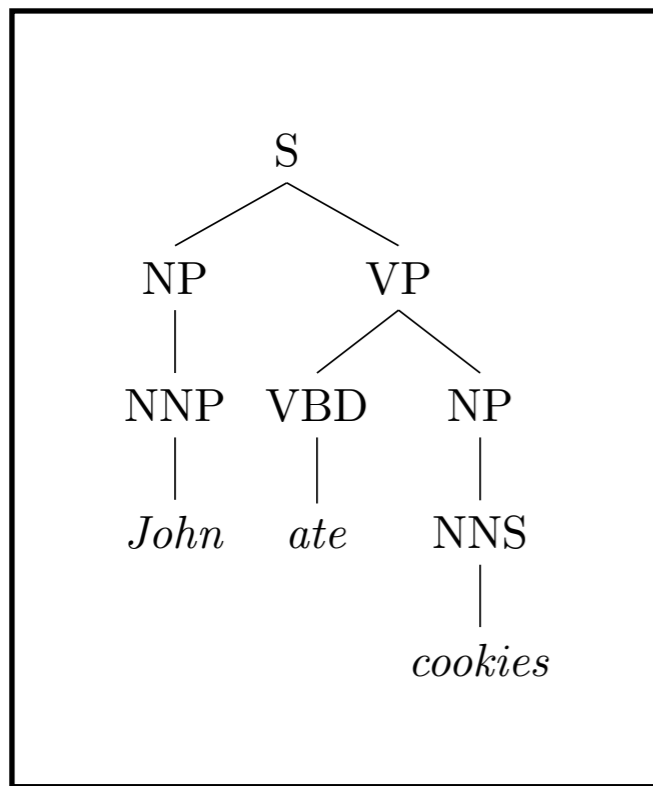

- Can see all of these approaches as methods for refining the nonterminals of the PTB.

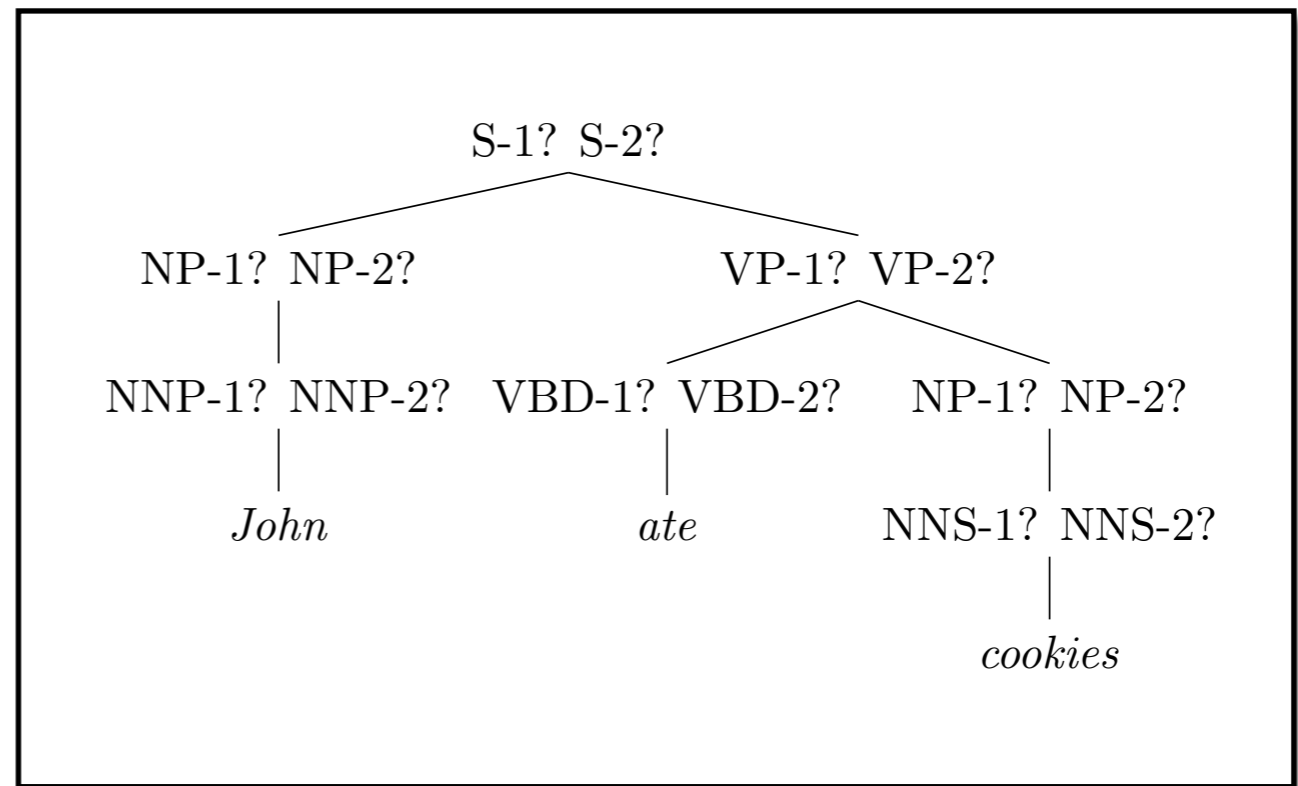

- Petrov et al. 06: Can we automatically learn how to refine (“split”) the nonterminals?

Split-Merge

original annotation

possible trees with state-split nonterminals

learn weights using EM

S-1 \rightarrow NP-1 VP-1
S-1 \rightarrow NP-1 VP-2
S-1 \rightarrow NP-2 VP-1 etc.

grammar with state-split NTs

+ “merge”: undo useless splits

Summary

- PCFGs that we read off of treebank suffer from overly strong independence assumptions.
- Improve parser accuracy by encoding context in nonterminal vocabulary.
 - ▶ parent annotations
 - ▶ lexicalization
 - ▶ rule-based and automatically computed state splitting
- Berkeley parser: f-score around 90.
